TITLE: The method of functional-operator transforms for electronic modelling of the non-stationary boundary value problems of mathematical physics

SOURCE: Analogovyye metody i sredstva resheniya krayevykh zadach (Analog methods and means of solving boundary value problems); trudy Vsesoyuznogo soveshchaniya, Moskva, 1962 g. Kiev, Naukova dumka, 59-68

TOPIC TAGS: electromodel, differential equation, harmonic function, transfer function, circuit design, boundary value problem, analog computer

ABSTRACT: The paper is devoted to a theoretical analysis of the synthesis of analog schemes for the solution of non-stationary boundary value problems in mathematical physics. The following theorem is first proven: It is possible to realize any rational-fractional transfer function $R_n(p)$ of the operator p by means of a circuit with regulated resistors, constant-value capacitors, and two amplifiers. The paper then applies this theorem to the problem of constructing an electronic model for the solution of the equation

$$L(u) = a(x) \frac{\partial^2 u}{\partial x^2} + b(x) \frac{\partial u}{\partial x} + c(x)u + a_1(x) \frac{\partial^2 u}{\partial t^2} + b_1(x) \frac{\partial u}{\partial t} = \varphi(x) \quad (1)$$

Card 1/2

L 59635-65

ACCESSION NR: AT5002494

with the initial and boundary conditions $u(x, 0) = \psi_0(x)$, $\frac{\partial u(x, 0)}{\partial t} = \psi_1(t)$; (2)
 where the solution is desired at the points x_i , $i = 1, \dots, N$.
 $u(0, t) = f_0(t)$, $u(l, t) = f_1(t)$. (3)

It is shown that: For each solution of equation (1), satisfying the initial conditions (2), for each triplet of values x_{i-1} , x_i , x_{i+1} , we have the relationship

$$A_{i-1,i}(p)u(x_{i-1}, t) + A_{i+1,i}(p)u(x_i, t) + A_{i-1,i}(p)u(x_{i+1}, t) = -B_i(p)\eta(t). \quad (4)$$

$$\eta(t) = \begin{cases} 1 & t > 0 \\ \text{npit} & t = 0 \\ 0 & t < 0. \end{cases} \quad (5)$$

On the basis of this theorem, the authors construct a general block diagram for an electronic model capable of solving this non-stationary boundary value problem.

Title : Influence of Unilateral Mechanical Pressure on the Dielectric Constant of Ceramic Ferroelectrics.

Orig Pub : Zh. tekhn. fiziki, 1956, 26, No 7, 1437-1442

Abstract : An investigation was made of the influence of unilateral pressure on the dielectric constant (ϵ) of ceramic ferroelectrics with a $BaTiO_3$ base. It was observed that there is a non-stationary variation in ϵ with time depending on the pressure p in weak fields E at $T < T_c$ (T_c is the Curie temperature), and this variation is characterized by the relation

$$\left| \frac{1}{\epsilon} \frac{\Delta \epsilon}{\Delta p} \right| = A_0 e^{-\alpha t}$$

where $A_0 > 0$ and is independent of the sign of the variation in P . When $T > T_c$ the result is a stationary relation

$\frac{1}{\epsilon} \frac{\Delta \epsilon}{\Delta p} = -k$. The non-stationary variation of ϵ with p changes into a stationary variation when $E > E_{cr}$. With

TITLE: Dependence of Dielectric Permittivity of Polycrystalline Ferroelectrics on Time under the Action of Mechanical Load and Constant Electric Field (Zavisimost' dielektricheskoy pronitsayemosti polikristallicheskikh segnetoelektrikov ot vremeni pri vozdeystvii mekhanicheskoy nagruzki i postoyanogo elektricheskogo polya)

PERIODICAL: Izvestiya Akademii Nauk SSSR, Seriya fizicheskaya, 1957, Vol 21 #3, pp 439-443 (USSR)

ABSTRACT: Investigations of the effect of one-sided mechanical load and constant electric field on dielectric permittivity of polycrystalline ferroelectrics permitted to discover some new regularities in the behavior of ferroelectrics.

A load was applied along the direction of the field. It was established that the dependence of dielectric permittivity on the time of applying a mechanical load bears a clearly defined non-stationary character for nonpolarized ferroelectric ceramics in weak electric fields at temperatures below the Curie

Card 1/3

48-3-22/26

TITLE: Dependence of Dielectric Permittivity of Polycrystalline Ferro-electrics on Time under the Action of Mechanical Load and Constant Electric Field (Zavisimost' dielektricheskoy pronitsayemosti polikristallicheskikh segnetoelektrikov ot vremeni pri vozdeystvii mekhanicheskoy nagruzki i postoyanogo elektricheskogo polya)

point. The dependence was of an exponential character for small time intervals, but deviated from the exponential law at long intervals.

At temperatures higher than the Curie point, the conventional stationary dependence of dielectric permittivity on the time of applying load held.

A pulse effect of a constant electric field on dielectric permittivity was also investigated. Square pulses of long duration (up to several min) were applied. Phenomena observed were analogous to those occurred at mechanical pressure. Below the Curie point, the value of dielectric permittivity increases and then decreases according to an exponential law. At temperatures higher than the Curie point, the stationary dependence holds.

Card 2/3

48-3-22/26

TITLE: Dependence of Dielectric Permittivity of Polycrystalline Ferroelectrics on Time under the Action of Mechanical Load and Constant Electric Field (Zavisimost' dielektricheskoy pronitsayemosti polikristallicheskikh segnetoelektrikov ot vremeni pri vozdeystvii mekhanicheskoy nagruzki i postoyanogo elektricheskogo polya)

The results obtained can be qualitatively explained from the viewpoint of the domain structure of ferroelectrics.

AUTHOR: Lur'ye, M. S.

TITLE: Thin Ferroelectric $Pb[Ti.Zr.Sn]_2O_3$ FilmsPERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 128, Nr 1,
pp 73 - 74 (USSR)

ABSTRACT: An investigation of the properties of ferroelectric films may be very useful for the solution of various problems, which are connected with the existence of space charge near the surface of a ferroelectric. Such investigations are also suited to a determination of electrical conductivity, of the effect of weakly penetrating radiations as well as to the solution of several other problems. The preparation of complex ferroelectric films would be desirable since the preparation of films with various properties would thus be possible. The three-component system of the solid solutions $Pb[Ti.Zr.Sn]_2O_3$ was chosen out of the presently known polycrystalline ferroelectrics. Provisional investigations carried out with ceramic samples showed that the hysteresis lines of several compositions of this system have a course similar to the rectangular one within a wide temper-

Card 1/3

Thin Ferroelectric Pb[Ti.Zr.Sn]₂O₃ Films

SOV/2o-128-1-18/58

ature range. These compositions formed the basis of the preparation of ferroelectric films. The films, which were about 2 μ thick, were prepared on a Pt foil; they have homogeneous, fine-grained structure. The visible transverse grain dimensions are found within the range 3-5 μ . According to a microphotogram taken at illumination at an oblique angle, the structure of the film surface is folded, which is obviously due to a variation of the volume during the annealing. Electric measurements yielded a rectangular hysteresis loop; besides, they indicated a great variation of the charge during the polarity reversal. The third diagram shows the dependence of the dielectric constant on the field strengths of the constant field, the alternating field, and the amount of voltages applied to the film. The films have a strongly nonlinear dielectric constant. The great value of the saturation field strength and the extraordinarily high flashover field-strength are also worth mentioning. At room temperature, the latter attains 300 kv/cm in the case of many samples. Such excessively high field strengths can obviously be explained by the existence of space charge in the surface layer (the thickness of which is of the same order as the total thickness of the film). The author

TITLE: Investigation of the negative resistance of Al₂O₃-metal contacts

19

SOURCE: Radiotekhnika i elektronika, v. 11, no. 2, 1966, 298-301

TOPIC TAGS: semiconductor, semiconductor device, semiconductor research

ABSTRACT: The N-type negative-resistance region of Al₂O₃-Me contacts was investigated by measuring current-voltage characteristics of film-type contacts in which the thickness of the dielectric varied from 100 to 500 Å. The Al₂O₃ layer was formed by oxidizing Al films obtained on glass by vaporization in vacuum. The upper electrode was formed by vacuum-spraying Cu, Sn, In, Au, Ni, Al. Measurements were conducted in air and in vacuum. With In₂Al/Sn electrodes, the negative resistance was observed with both polarities of the applied voltage; with the Al electrode, the negative resistance could be detected only in vacuum. With Cu, Ni,

Z

Card 1/2

L-27521-66

ACC NR: AP6007508

Au electrodes, the negative resistance was observed only in the forward branch of the current-voltage characteristic. In all cases, the maximum current decreased and the negative resistance increased with the increasing layer thickness. Qualitatively, the I-V function could be explained by the Schottky emission law. Electron capture by multicharge centers is assumed to be responsible for the mechanism of the negative resistance. Orig. art. has: 5 figures.

B006/B056AUTHORS: Lur'ye, M. S., Vasil'yeva, Ye. I., and Ignat'yeva, I. V.TITLE: Ferroelectric Films With Rectangular Hysteresis LoopPERIODICAL: Izvestiya Akademii nauk SSSR. Seriya fizicheskaya, 1960,
Vol. 24, No. 11, pp. 1376 - 1379

TEXT: The present paper is a reproduction of a lecture delivered on the 3rd Conference on Ferroelectricity, which took place in Moscow from January 25 to 30, 1960. The authors give a report on experimental investigations of influencing the rectangularity of the dielectric hysteresis by various factors. In the introduction, the influences exerted by the anisotropy of the unit cell (G. A. Smolenskiy) and the domain orientation and crystallographic structure (Ya. M. Ksendzov) are discussed. In the following, the opinion is expressed that the chemical bonds in the crystal lattice essentially influence the shape of the hysteresis; thus, e.g., it is known that when in the system of the solid solution $(Ba,Pb)TiO_3$, Ba^{2+} ions are replaced by Pb^{2+} ions, the

Card 1/4

Ferroelectric Films With Rectangular Hysteresis Loop

S/048/60/024/011/019/036
B006/B056

homeopolarity increases and also the rectangularity of the hysteresis, although the anisotropy of the unit cell increases (Smolenskiy had assumed that an improvement of rectangularity is due to a decrease of anisotropy). The authors investigated solid solutions of the system $Pb(Ti,Zr,Sn)O_3$, in form of thin disks, to which silver electrodes were fitted. Fig.1 shows $\epsilon(E)$ for some of the investigated compositions. It was found that the nonlinearity of the samples increases with increasing $PbTiO_3$ content, and has a maximum near the morphotropic transition from the rhombohedral into the tetragonal phase (near 45% $PbTiO_3$). As may be seen from Fig.2, the rectangularity increases with increasing $PbTiO_3$ content. As shown in Fig.3, the parameters remain unchanged within a wide temperature range. From the compositions given in the Table, the authors produced 2 μ thick polycrystalline films on platinum foils or on platinum-plated ceramics, which they investigated. Fig.4 shows the hysteresis loops for films with Pt - Ag-electrodes and for films with Pt - In electrodes. Fig.5 shows $\epsilon(E)$, as in the usual samples recorded at 50 cps, and Fig.6 shows the dependence of the nonlinearity of the

Synthesis of hydrocarbons. XXV. Synthesis of alkenes and alkanes with two or more carbon atoms
Ryo Iwasa, T. Nishizawa, and S. Yamada
M. Y. Lur Ye (Meiyang Chemical Co., Ltd.)
Received April 1, 1953; cf. C.A. 47, Reford, 43, 2676.
MeCuI (70 g.) in 1 vol. Et₂O was added to 1.1 g.
under Et₂Ni(Mg activated with 1.8 g. LiClO₄Br_{1.2})
the next reagent with stirring. It was cooled to -78°
treated over 0.5 hr. with 72 g. HBr adduct (I) of MeCu-
CHCMe₂CH₃ in 1 vol. Et₂O, stirred 3 hrs. at -60° and 2
hrs. at room temp., left overnight, stirred with heating
flame, and decoupled with ice-NH₄Cl; the org. layer yielded
17% 2,2,3,3,5-pentamethyl-1-hexene, which, after purification
over Na, b.p. 76-79.2°, n_D²⁰ 1.1470, d₄ 0.7806. The higher
boiling material yielded 17% 2,3,4-trimethyl-1,3-butadiene
dimer, b.p. 217-18°. Hydrogenation of the dimer over
Ni-Al₂O₃ at 103-70° gave 2,3,3,3,5-pentamethylhexane, b.p.
172.8-17.5°, n_D²⁰ 1.4332, d₄ 0.7673. Similarly MeCuC₆H₅
with I gave 14% 2,3,3,5-tetramethyl-3-ethyl-4-heptene (II),
b.p. 210.5-11.5°, n_D²⁰ 1.4574, d₄ 0.8912, and 55% 1,1,1,
methyl-3-heptene, b.p. 130.5-1.0°, n_D²⁰ 1.4222, d₄ 0.7771.
II was hydrogenated to 2,2,3,4-tetramethyl-3-heptene, b.p.
214.5-15.0°, n_D²⁰ 1.4440, d₄ 0.7891. G. M. K.

Cyanoethylated ketones in the synthesis of unsaturated δ -lactones. II. Synthesis and properties of unsaturated δ -lactones from γ -acetylvaleronitrile. R. Ya. Levina, N. P. Shushberina, and M. Yu. Lurys (Moscow State Univ.), *Zhur. Obshch. Khim.*, 24, 1430-43 (1954); cf. R. Ya. Levina, N. P. Shushberina, and T. A. Kaminskaya, *C.A.*, 47, 48440 (1954). γ -Acetylvaleronitrile (I), bp. 110-12°, and 50% γ -acetyl- γ -methylpropiononitrile, m.p. 07°, I (30 g.) refluxed with 80 ml. 2:1 HCl 3 hrs. gave $\text{AcCH}_2\text{MeCH}_2\text{CH}_2\text{CO}_2\text{H}$ (II), bp. 140-15°, n_D^{20} 1.4483, d₄ 1.0674; *semicarbazone*, m.p. 123°; *Ei ester*, bp. 68°, n_D^{20} 1.4320, d₄ 0.9803. Treatment of the free acid with dioxane-Br gave $\text{AcCH}_2\text{MeCH}_2\text{CH}_2\text{CO}_2\text{H}$, m.p. 79-80°. II (34 g.) and 125 ml. Ac₂O refluxed with a few drops AcCl 2 hrs. gave 60% $\text{Me}_2\text{C}(\text{CH}_2\text{CH}_2\text{CO}_2\text{H})_2$ (III), b.p. 210°, m.p. 03°, n_D^{20} 1.4738, d₄ 1.0857; on standing this slowly developed acidic properties owing to slow hydrolysis. The lactone III treated with Br in CCl₄ gave a dibromide, m.p. 123° (from petr. ether), which treated with H₂O gave $\text{AcCH}_2\text{MeCH}_2\text{CH}_2\text{CO}_2\text{H}$, identical with the above described sample. Moisture converts III to II; in 20% EtOH, in 4 days some 40-50% of III is converted to II; but 10% KOH gives total conversion in 1 hr. Shaking I with concd. NH₄OH gave $\text{AcCH}_2\text{MeCH}_2\text{CH}_2\text{CNH}_2$, m.p. 124° (from EtOAc). III in dry EtOH satd. with dry HCl at 0° gave 60% II *Ei ester*, whose *semicarbazone*, m.p. 86-7°, was identical with a specimen from the above described sample of the ester. Hydrogenation of III over Si-Al₂O₃ at 200° gave *3,5-dimethyltetrahydro-2-pyrone*, b.p. 107-9°, n_D^{20} 1.4550, d₄ 1.0202... G. M. E.

~~SECRET~~

Unsaturated δ -lactones from monocyanopropylated cyclic ketones. N. P. Shusharina, B. Ya. Lysogorskiy, M. Yu. Lur'e, and V. I. Zdanovich, *Vestnik Moskov. Univ.* No. 10, No. 10, Ser. Fiz.-Mat. i Estestven. Nauk No. 7, 123-5 (1956).—
Cyclohexanone with CH_3CHCN (Ia) gave 4% α -(β -cyanethyl)- γ -hexanone (Ib), b_1 140-7°, n_D^{20} 1.4777, d_4 1.0215, m 113-14°. Ib was converted by boiling with dil. acid to the corresponding ketone (55%), b_1 90-1°; this heated with Ac_2O gave 80% Δ^4 -hexahydrocumarin, b_1 117-18°, d_4 1.1183, n_D^{20} 1.5050, M_R 40.42. β -Tetralone with Ia in dioxane contg. KOH gave 40% α -(β -cyanethyl)- β -tetralone (II), b_1 187-8°, d_4 202-4°, n_D^{20} 1.5635, d_4 1.1367, M_R 66.97, E_M 0.75. The distill. residue from I was α,α -bis(β -cyanethyl)- β -tetralone, m. 96° (from C_2H_4), and boiled with HCl-AcOH gave 78% 5,6-benzo- Δ^3 -tetrahydrocumarin, m. 99-100° (from EtOH), and b_1 187-8°. α -Tetralone, Ia, and KOH in dioxane gave 30% β -(β -cyanooethyl)- α -tetralone (III), b_1 203-5°, m. 69-80°. Boiling II with concd. HCl-AcOH gave 82% β -(β -carboxyethyl)- α -tetralone, m. 107-8°, 70% 7,8-benzo- Δ^4 -tetrahydrocumarin. Similarly cyclopentanone and Ia gave α -cyclopentylidene cyclopentanone, b_1 125-6°, n_D^{20} 1.5104, d_4 1.0175, and 25.5% α -(β -cyanooethyl)cyclopentanone (IV), b_1 m. 125-6°, n_D^{20} 1.4720, d_4 1.0402, M_R 36.88. Hydrolysis of III with HCl gave up to 70% α -(β -carboxyethyl)cyclopentanone (IV), b_1 175-70°, n_D^{20} 1.4775, d_4 1.1432, M_R 38.66; semicarbazone, m. 215-16° (decompn.). Heating IV with Ac_2O yielded 74% 5,6-cyclopenteno-3,4-dihydro- α -pyrone, b_1 118-19°, n_D^{20} 1.4990, d_4 1.1272, M_R 36.00.

Title : Cyanoethylated Ketones in the Synthesis of Unsaturated Delta-Lactones. V. Synthesis and Properties of Unsaturated Delta-Lactones from Monocyanoethylated Acetone and Cyclohexanone.

Orig Pub : Zh. obshch. khimii, 1956, 26, No 3, 750-755.

Abstract : By hydrolysis of monocyanoethylated cyclohexanone (I) and acetoacetic ester (II) (in the latter case there takes place concurrently with hydrolysis a decarboxylation) were prepared cyclohexanone-2-beta-propionic (III) and gamma-acetylbutyric (IV) acids, lactonization of which results, respectively, in delta^{9,10}-hexahydro-coumarine (V) and 6-methyl-3,4-dihydro-alpha-pyrone (VI). Structure of I and VI is established by their conversion, respectively, to III and IV (hydrolysis), their esters

Card 1/4

(alcoholysis and amides (ammonolysis). On hydrogenation of V and VI over PtO₂ (~ 20°) were obtained beta-cyclohexylpropionic (VII) and caproic (VIII) acids. To 5 mole cyclohexanone and 2 ml 40% solution of NaOH in CH₃OH is added, with stirring, at a temperature < 40°, 1 mole acrylonitrile (IX); obtained I, yield 47%, BP 146-147°/6 mm, n²⁰D 1.4697, d²⁰ 1.0215. Mixture of 24.5 g I, 40 ml concentrated HCl and 20 ml water boiled 2 hours, III extracted with ether, yield 85.5%, BP 180-181°/10 mm, MP 60-61° (from benzene); semicarbazide, MP 184° (decomposes; from aqueous alcohol). Mixture of 10 g III and 18 g (CH₃-CO)₂O heated 4 hours; obtained V, yield 83%, BP 117-118°/5 mm, n²⁰D 1.5050, d²⁰ 1.1166. On heating with 10% solution of NaOH (0.5 hours) V is quantitatively converted to III. Solution of 5 g V in 50 ml absolute alcohol saturated with gaseous HCl, poured into water, extracted with ether; obtained ethyl ester of III, BP 134-135°/7 mm,

n^{20}_D 1.4626, d_4^{20} 1.0350; semicarbazide, MP 105-106° (from aqueous alcohol). By shaking V with NH₄OH there is obtained the amide of III, MP 163-164° (decomposes; from water). Hydrogenation of 0.08 mole V over PtO₂ in absolute alcohol gives VII, yield 66%, BP 112-113°/4 mm, n^{20}_D 1.4654, d_4^{20} 1.0104; amide, MP 119-120°; phenylhydrazide, MP 155-156° (from aqueous alcohol). To a solution of C₂H₅ONa (from 0.5 g Na and 100 ml alcohol) added 1 mole aceto-acetic ester and 0.8 mole IX (stirring, temperature < 40°), alcohol driven off, neutralized with CH₃COOH and extracted with ether; obtained II, yield 47%, BP 155-156°/10 mm, n^{20}_D 1.4480, d_4^{20} 1.0690, and dicyanethyl-derivative, yield 25 g, MP 82-83° (from alcohol). Mixture of 30 g II, 17 ml water and 17 ml concentrated H₂SO₄ and 50 ml CH₃COOH, boiled 5-7 hours, diluted with water and extracted with ether for 10 hours; obtained IV, yield 57%, BP 152-154°/10 mm, n^{20}_D 1.4462, d_4^{20}

Card 3/4

1.110; semicarbazide, MP 173° (from aqueous alcohol). Analogously to V is obtained VI, yield 57%, BP 72-73°/10 mm, 82-83°/15 mm, n^{20}_{D} 1.4650, d_4^{20} 1.0782; on using CH_3CCl_3 in lieu of $(\text{CH}_3\text{CO})_2\text{O}$ the yield is 67%. VI, analogously to the above described procedure for V, is converted to IV (semicarbazide, MP 173°), its ethyl ester, BP 104-105°/12 mm, n^{20}_{D} 1.4275, d_4^{20} 0.9971; semicarbazide, MP 114-115°; amide, MP 112-113° (from chloroform), and VIII, yield 69.7%, EP 105-107°/15 mm, n^{20}_{D} 1.4190; phenylhydrazide, MP 100° (from aqueous alcohol). Hydrogenation of 15 g VI over $\text{Ni}/\text{Al}_2\text{O}_3$ at 180-200°, gives 6-methyl tetrahydro-alpha-pyrone, yield 7 g, BP 114-116°/23 mm, n^{20}_{D} 1.4425, d_4^{20} 1.0162.

LURYE, M.Yu.

*Cyanoethylated ketones in the synthesis of unsaturated
lactones. & Lactones with hemicyclic double bond.*

Levina, N. P., Smusheva, M. Yu., Lur'e, and N. D. Orlova
(M. V. Lomonosov State Univ., Moscow). *Doklady Akad.*
NAUK S.S.R., 100, 279-302 (1955). Addn. of 16 g. $\text{CH}_3\text{CH}_2\text{CN}$ to 151 g. iso-Pr₂CO, 2.5 ml. 30% MeOH-KOH, and
2 ml. $\text{Me}_2\text{CHCOCH}_2\text{CH}_2\text{CH}_2\text{CN}$ (I), at 34-40°, followed by
4 hrs. at room temp. gave 70% I, b.p. 124-6°, n_D^{20} 1.4428, d_{40}° 0.9241. It refluxed with aq. KOH gave 80% $\text{Me}_2\text{CHCOCH}_2\text{CH}_2\text{CO}_2\text{H}$ (II), b.p. 153-7°, n_D^{20} 1.4500, d_{40}° 1.0100; II
ester, b.p. 114-16°, n_D^{20} 1.4370, d_{40}° 0.9532. II (20 g.) refluxed
3 hrs. with 75 ml. AcCl gave, after aq. treatment, 43.5%
5,5-dimethyl-6-isopropylidenecyclohex-2-pyrene, b.p. 111-13°,
 n_D^{20} 1.4800, d_{40}° 1.0112, and apparently II enkydride, m.
b.p. 60°, b.p. 192-4°. The lactone in abs. EtOH was treated
with dry HCl yielding 78% II Et ester. Addn. of 16.0 g.
 $\text{CH}_3\text{CH}_2\text{CN}$ to 21.5 g. iso-PrAc, 2.3 g. Me₂COH, and 5.3
ml. MeOH-KOH at under 40°, followed by stirring 3-4 hrs.
gave 41.7% d. $\text{CH}_2\text{CH}_2\text{CH}_2\text{CN}$, b.p. 126-7°, n_D^{20} 1.4420, d_{40}°
0.9451. Hydrolysis as above with KOH gave the carboxylic
acid, b.p. 160-60°, m. 46-7°, in 97% yield; *Et ester* (III), b.p.
117-18°, n_D^{20} 1.4570, d_{40}° 0.9790 (semicarbazone, m. 77-8°).
The free acid with AcCl gave 85% 5,5-dimethyl-6-methylene-
triketohydro-2-pyrene, b.p. 55-6°, n_D^{20} 1.4730, d_{40}° 1.038. The
lactone hydrolyzes slowly to the free acid in moist air; in
aq. soln. it is 57-60% hydrolyzed in 20 hrs. The lactone
with EtOH and dry HCl, as above, gave 70% III. Shaking
the ketones with concd. NH₄OH gave, resp., 90% iso-Pr₂CO-
 $\text{CH}_2\text{CH}_2\text{CONH}_2$, m. 86-7°, and 70% $\text{AcCH}_2\text{CH}_2\text{CH}_2\text{CONH}_2$, m. 113-15°; the latter on heating readily forms the
lactam 5,5-dimethyl-6-methyleneperidone, m. 103-9°.

ABSTRACT: In their previous report the authors for the first time described the reaction between the dibromide of unsaturated β -lactones, i.e. 5,6-dibromo-5,6-dimethyltetrahydro- α -pyron and water, namely, the binding with water with opening of the lactone cycle and separating of a molecule of hydrogen bromide. This leads to the formation of γ -bromo- γ -acetyl valeric acid with quantitatively correct yield. The structure of this acid was checked by counter-analysis, i.e. bromizing of the γ -acetyl valeric acid by dioxane-bromide. In the present work it is shown that reaction between the dibromides of the unsaturated lactones and water may serve as a general method of preparing a γ - or ϵ -bromine-substituted δ -ketone acid. In this way the following preparations, which have hitherto not been described in publications were produced: 4-bromine hexanon-5-carbonic acid, 6-bromine-4,4-dimethylhexanon-5-carbonic acid, 6-bromine-4,6,6-trimethylheptanon-5-carbonic acid, and 2-bromine-2-(β carboxyethyl)-cyclopentanon. Structure formulae are given. In the course of their

δ-Lactones. Transformation of the Dibromides of Unsaturated δ-Lactones into Bromine Substituted δ-Ketone Acids and their Ethers. further investigation of the reactivity of dibromine lactons they first studied their reaction with ethanol. Here the binding of alcohol is effected by the opening of the lactone cycle, the separating of a molecule from hydrogen bromide, and ethyl ethers of γ - or δ -substituted δ-ketone acids. By means of this reaction the ethyl ethers hitherto not described in publications of the above mentioned bromine-ketone acids were obtained. Also in this case structure was checked by means of a counter-synthesis of one of them: ether XI was obtained by the action of dioxandibromide on ethyl ether of γ -acetyl butiric acid. In the experimental part each single reaction together with conditions and results was described. (6 groups of chemical formulae, 2 tables, 5 citations from Slav publications)

ABSTRACT

In previous papers the author described the preparative method of production by interaction of dibromides of unsaturated δ-lactones with water. The present paper shows that the γ-bromine and δ-ketone acids obtained in this way go over into butyroactones under the effect of a cold saturated solution of sodium acetate, which are acylated in position 5. Five different lactones were obtained from the corresponding acids, so that the reaction mentioned may serve as a preparative method for the production of acylated butyrolactones. In all cases (with the exception of case I: 5-acetylbutyrolactones) also the formation of isomeric saturated 6-membered lactones (VII) can be presumed if the reaction had developed by the intermediate formation of unsaturated ketone acids. This, however, does not apply as it was shown that the unsaturated ketone acid (VII), which was synthesized particularly for this purpose, is not changed under the influence of a saturated aqueous solution of sodium acetate. The substances I-V cannot be titrated with aqueous and alcoholic solutions of alkalies, they do not discolor

TITLE: δ -Lactones (δ -Laktony). XII. Synthesis and Properties of
6-Phenyl-3,4-Dihydro- α -Pyrone (Sintez i svoystva 6-fenil-3,4-
-digrido- α -pirona)

PERIODICAL: Zhurnal Obshchey Khimii, 1958, Vol. 28, Nr 5,
pp. 1351 - 1355 (USSR)

ABSTRACT: In previous publications a synthesis of unsaturated δ -lactones (3,4-dihydro- α -pyrones) from monocyno-ethylated aliphatic and alicyclic ketones (Reference 1-4) was described. In the present paper the unsaturated lactone, 6-phenyl-3,4-dihydro- α -pyrone (formula III), was synthetized this way (see scheme 1). From references¹⁻⁴ is known that the cyano-ethylation of acetophenone either leads to the tricyano-ethylated derivative (Reference 5) or to the mixture of monocyno-ethylated (13%) and dicyano-ethylated acetophenone (Reference 6). The authors succeeded in finding conditions on which this treatment makes it possible to synthesize the γ -benzoylbutyro-

Card 1/3

δ-Lactones. XII. Synthesis and Properties of 6-Phenyl-3,4-Dihydro- α -Pyrone

-nitrile (I) (28-35%) only. The hydrolysis of nitrile (I) in γ -benzoylbutyric acid (II) and its conversion to lactone (III) occurred with respective yields of 100 and 75%. It was further shown that on the action of an equimolar amount of bromine on the lactone (III) a liquid dibromide (IV) forms which, similar to the earlier described dibromo-lactone (IV), converts on the treatment with water to the γ -bromo- γ -benzoylbutyric acid (VI) in a yield of 86.5%. In the vacuum distillation in a dry air current the dibromolactone converts to the 6-phenyl- α -pyrone (phenylcoumalin, V) on which occasion the initial product, the unsaturated δ -lactone (III), is reforming, however. Thus in the distillation of dibromo-lactone (IV) the cleavage of two molecules of hydrogen bromide leads to the formation of a-pyrone (V), while the cleavage of bromine causes the formation of the initial lactone (scheme ?). There are 14 references, 6 of which are Soviet.

TITLE: δ -Lactones (δ -Laktony). XIV. Synthesis of 6-Methyl-5-alkyl- α -pyrones (Sintez 6-metil-5-alkil- α -pironov)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 2, pp 403-407 (USSR)

ABSTRACT: The authors found earlier that on distilling 5,6-dibromosubstituted bi and tricyclic δ -lactones, the corresponding α -pyrones are formed (Scheme 1). δ -lactones are obtained by the bromination of δ -enollactones, which in their turn are formed by condensation from polymethylene cycles in the position 5,6. In the work under review this method was used for the synthesis of 5,6-di-alkyl- α -pyrones. It is shown that on distilling 5,6-dibromo-6-methyl-5-alkyl-tetrahydro- α -pyrones (V-VIII), formed in connection with the bromination of 6-methyl-5-alkyl-3,4-dihydro- α -pyrones (I-IV) (Ref 3), the corresponding α -pyrones are obtained in yields of 10-17%. The low yield is explained by the circumstance that besides the dehydrobromination of dibromides (V-VIII) they also undergo debromination which fact leads to the formation of the unsaturated initial δ -lactones (I-IV) (in yields of 50-60%) (Scheme 2). The yield in α -pyrones can be increased to

Card 1/2

δ -Lactones. XIV. Synthesis of 6-Methyl-5-alkyl- α -pyrones SOV/79-29-2-10/71

25-46% by an appropriate pre-heating of the dibromo-lactones at 130-140° in vacuum and by a further fractionated distillation of the δ -lactones forming therefrom (excepting the compound (IX) which is separated from lactone (I) by freezing). The following difficultly accessible and hitherto unknown 5,6-dialkyl-substituted α -pyrones were obtained in this way: 5,6-dimethyl, 6-methyl-5-ethyl, 6-methyl-5-propyl and 6-methyl-5-butyl- α -pyrone (IX, X, XI, XII) in yields of 27, 25, 38 and 46%, correspondingly. There are 1 table and 7 references, 5 of which are Soviet.

TITLE:

Investigations of the Chemistry of Chloromycetin (1-Mycetin).
IX. Synthesis of the New Analog of Chloromycetin (D-TREO-1-
(n-formylphenyl)-2-dichloroacetylamino-1,3-propanediol)

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 8, pp 2531 - 2533
(USSR)

ABSTRACT:

Of the analogs of chloromycetin (I, R=CHCl₂) this hitherto un-described analog is of special importance (IV, X=CHO; R=CHCl₂). The presence of the aldehyde group within it allows for the synthesis of a large number of other hitherto little accessible chloromycetin analogs, which are important for the further explanation of the varied dependence of the antimicrobial activity on the structure of these compounds. On the basis of the method elaborated by W. F. Beech (Ref 2) for the introduction of the aldehyde group into the aromatic ring by way of diazo compounds, the authors succeeded in applying the simple synthesis of optically active chloromycetin analogs (IV, R=CHCl₂) directly from chloromycetin (I, R=CHCl₂), suggested by them (Ref 3), for the

(1-Mycetin). IX. Synthesis of the New Analog of
Chloromycetin (D-TREO-1-(n-formylphenyl)-2-dichloroacetylaminoo-1,3-propanediol)

synthesis of the aldehyde they were interested in (Schemes). Initially, the transformation did not proceed from compound (I) but from its racemic N-benzyl analog (I, R=C₆H₅), since in this way crystallizing compounds are more easily obtained. With it, the diazo group was replaced by the aldehyde group in compound (III, R=C₆H₅) under conditions suggested by Beech (Ref 2) as an optimum. Compound (IV, X=CHO; R=C₆H₅) was easily separated in crystalline form (yield 15%). This aldehyde was then characterized in the form of the 2,4-dinitrophenyl hydrazone and other derivatives. The synthesis of compound (IV, X=CHO; R=CHCl₂) proceeded more difficultly. It was synthesized as above from compound (III, R=CHCl₂). However, it was not possible to obtain it in crystalline state even after careful purification. This aldehyde was characterized in the form of the 2,4-dinitrophenyl hydrazone (yield 12%). There are 3 references, 2 of which are Soviet.

TITLE: Present Problems of Drying Technique (Sovremennyye problemy su-shil'noy tekhniki)

PERIODICAL: Khimicheskaya nauka i promyshlennost', 1958, Vol III, Nr 6,
pp 748-752 (USSR)

ABSTRACT: The time needed for drying is reduced if the temperature difference between the drying gas and the material dried is very high, or if the specific surface per unit volume is very small. The drying of granules of 10 mm in diameter in the vacuum filter lasts 20 min, but the same substance sprayed in the form of particles 100 μ in diameter dries in 0.5 - 1 sec. The equality of the drying is of great importance, because the process may be stopped only after the whole quantity is dry. Tunnel-type drying installations 75 - 100 m long are used for this purpose. Installations operating by their own draft are more economical than the ventilation types. If waste gases are used for drying, special mixing chambers must be designed, where the gases are mixed with air in order to obtain the right temperature. For the drying of cotton drying chambers have been designed (Figure 2) which are fueled by waste gases. Drying drums have been developed for the chemical industry (Figure 1). Pneumatic drying devices are used for the treatment of food products,

Card 1/2

Present Problems of Drying Technique

SOV/63-3-6-6/43

sunflower seeds, etc. A powerful drying installation for cereals is shown in Figure 3. It has an output of 50 t/h. A drying sprayer for sodium-ammonium sulfate (Figure 5) dries and collects the dust in a single apparatus. Another sprayer for medical substances, like antibiotics, operates with temperatures of 150 - 200°C, which heat the dried substance to 40°C (Figure 7). Shelf chambers are used for the drying of small quantities of chemical substances, infrared rays for varnishes and paints as well as for impregnated fabrics.

TITLE: A reactor for combined pulverizing and burning of a material, such as cement,
in a high temperature gas stream. Class 80, No. 145469

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 22, 1965, 101

TOPIC TAGS: cement, thermal reactor

ABSTRACT: This Author Certificate presents a reactor for combined pulverizing and
burning of a material, such as cement, in a high temperature gas stream. To provide
automatic regulation of the burning and calcification time for the material in the
reactor, the latter is made in the shape of a flat, lenticular chamber. Nozzles
of the combustion chambers are built into the peripheral circle of the lenticular
chamber and at an angle to its radii. An opening in the center of the chamber bottom
is used to discharge the finished burned product.

Abstract : Use of guides made out of textolite or similar plastics
in lathes, boring, milling, broaching machines, etc., has
been an accepted practice for some time. The author
describes installation of PT-mark textolite guides to
safeguard smoothness of moving parts on the MV6010-Model
heavy planetary hydraulic internal grinder, which is
used for holes 200 to 500 mm in diameter and up to
1,000 mm long. The relevant parts of the machine
including the guides were given through tests, and
the results obtained were tabulated. The Experimental
Scientific Research Institute of Metal-Cutting Machines
(ENIMS), as well as several machine-tool plants are
